(54) VERIFICATION SYSTEM FOR AD HOC WIRELESS COMMUNICATION

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a verification system for ad hoc wireless communication that can simply verify data integrity in data transmission reception by ad hoc wireless connection.

SOLUTION: A request source and a request destination for opening an encryption communication path are respectively defined to be a transmission source A and a transmission destination B. A verification data generating algorithm ID 1 is arranged in advance between the parties A, B. The A transmits e.g. a public key Kp of the A to the B, generates verification data Xp from the public key Kp by using the algorithm ID 1 and outputs the data to its own verification image display section 27.

The B receives the data Kx sent from the A as the key Kp. generates verification data Xx from the Kx by using the ID 1 A: (《佐汉元。) B(伝送先) 経密はでほ号

and outputs the data to its own verification image display section 27. A verifier discriminates that there exists data integrity when the Xp, Xx of the verification image display sections 27 of the parties A, B are coincident.
